

❖ IC COURSE PROJECT

Group Members:

NAME (Roll no.)	Batch
1. Ritesh Prajapat(B24ME1061)	- A6
2. Hari Om Jangir(B24EE1023)	- A5
3. Dipanshu Yadav(B24CH1018)	- A5
4. Raunak Kumar(B24CS1062)	- A3

Our Project Title: **Mini Voting System.**

➤ **Introduction**

Our project is mainly focused to create a online voting method. This project seeks to address the growing need for modern voting solutions that enhance participation and streamline election management.

➤ **Inspired from**

Even today, we see in most of times ballot paper is used for casting vote. That takes too much time for result declaration. Some days before, election for hostel general secretary was happened. We observed that for voting for such small election takes too much time. Also the result was declared after 2-3 days. So, for such mini elections, we can build a

online voting system which will reduce the overall time taken in these small scale elections. We can also check the voters identification(eg. by taking their roll numbers, Name, etc.)

There are many **Key Features** in this as:

- **Real-Time Results:** Providing immediate feedback and results, which can enhance transparency and trust in the electoral process.
- **User-Friendly Interface:** Designing an intuitive platform that makes voting easy and straightforward for all users.
- **Admin Panel:** we can manage elections, including candidate management, voter management, and result aggregation.
- **User Registration and Authentication:** Secure user registration and login processes, ensuring that only eligible voters can participate.

Concepts we are using:

- We will create functions for each feature, and organize the code into a menu-driven structure that displays a list of options to the user, and then executes the corresponding function based on the user's selection.
- To store candidate info, options, and vote counts, we will use the arrays and Implement a loop to continuously display updated vote counts and allow new votes.
- The functionality of our mini voting system is mentioned below.
 - 1) Give input about the candidate's name and their other details.
 - 2) Take input from the user/voters.
ensure their authentication for casting votes.
 - 3.) Storing Votes of each candidates.

4.) Calculating Votes

5.) Declaring Results, WINNER and votes of each candidates.

➤ **Our Plans:**

At first, we are trying to find some way to check the authentication of the voters. Currently we don't have any idea how we can check the voters credentials and restrict them to cast only one vote per I'd.

Then we also have to provide some unique symbol/character according to candidate's choice and voters will cast their votes by selecting their symbols. We are thinking how we can implement this in our code.

After collecting all the votes from all the eligible Voters, we will store them in our variable for each candidates and on completion of voting we will calculate the votes of each candidate and will display them to the users.
